STMicroelectronics

ST54L A02
Security Target for composition

Common Criteria for IT security evaluation

SMD_ST54L_ST_22_001 Rev A02.1

February 2024
1 Introduction (ASE_INT)

1.1 Security Target reference

1 Document identification: ST54L A02 SECURITY TARGET FOR COMPOSITION.

2 Version number: Rev A02.1, issued in February 2024.

3 Registration: registered at ST Microelectronics under number SMD_ST54L_ST_22_001.

1.2 TOE reference

4 This document presents the Security Target (ST) of the ST54L A02 Security Integrated Circuit (IC), designed on the ST33 platform of STMicroelectronics, with firmware version 3.2.2.

5 The precise reference of the Target of Evaluation (TOE) is given in Section 1.4: TOE identification and the security IC features are given in Section 1.6: TOE description.

6 A glossary of terms and abbreviations used in this document is given in Appendix A: Glossary.
Contents

1.3 **Context**

7 The Target of Evaluation (TOE) referred to in Section 1.4: **TOE identification**, is evaluated under the Dutch IT Security Evaluation and Certification Scheme and is developed by the Connected Security sub-group of STMicroelectronics (ST).

8 The assurance level of the performed Common Criteria (CC) IT Security Evaluation is EAL6 augmented by ALC_FLR.2.

9 The intent of this Security Target is to specify the Security Functional Requirements (SFRs) and Security Assurance Requirements (SARs) applicable to the TOE security ICs, and to summarise their chosen TSF services and assurance measures.

10 This ST claims to be an instantiation of the "Eurosmart - Security IC Platform Protection Profile with Augmentation Packages" (PP) registered and certified under the reference BSI-CC-PP-0084-2014 in the German IT Security Evaluation and Certification Scheme, **with the following augmentations**:
   - Addition #1: “Support of Cipher Schemes” from AUG
   - Addition #4: “Area based Memory Access Control” from AUG
   - Additions specific to this Security Target, some of which in compliance with JIL-Post-Deliv-Load and ANSSI-CC-CER/F/06.003.

The original text of this PP is typeset as indicated here, its augmentations from AUG as indicated here, and text originating in JIL-Post-Deliv-Load and ANSSI-CC-CER/F/06.003 as indicated here, when they are reproduced in this document.

This ST instantiates the following packages from the above mentioned PP:
   - Authentication of the Security IC,
   - Loader dedicated for usage in secured environment only,
   - Loader dedicated for usage by authorized users only.

11 Extensions introduced in this ST to the SFRs of the Protection Profile (PP) are **exclusively** drawn from the Common Criteria part 2 standard SFRs.

12 This ST makes various refinements to the above mentioned PP and AUG. They are all properly identified in the text typeset as indicated here. The original text of the PP is repeated as scarcely as possible in this document for reading convenience. All PP identifiers have been however prefixed by their respective origin label: BSI for BSI-CC-PP-0084-2014, AUG1 for Addition #1 of AUG, AUG4 for Addition #4 of AUG, and JIL for JIL-Post-Deliv-Load and ANSSI-CC-CER/F/06.003.

1.4 **TOE identification**

13 The Target of Evaluation (TOE) is the ST54L A02.

14 “ST54L A02” completely identifies the TOE including its components listed in Table 1: TOE components, its guidance documentation detailed in Table 14: Guidance documentation, and its development and production sites indicated in Table 15: Sites list.

15 A02 is the version of the evaluated platform. Any change in the TOE components, the guidance documentation and the list of sites leads to a new version of the evaluated platform, thus a new TOE.
The IC maskset name is the product hardware identification. The IC version is updated for any change in hardware (i.e. part of the layers of the maskset) or in the OST software.

All along the product life, the marking on the die, a set of accessible registers and a set of specific instructions allow the customer to check the product information, providing the identification elements, as listed in Table 1: TOE components, and the configuration elements as detailed in the Data Sheet, referenced in Table 14: Guidance documentation.

1.5 TOE overview

The ST54L A02 is included in the ST54L platform, a near-field communication (NFC)-compatible device that comprises a contactless front-end (referred to as the ST54L_CLF), and a secure element (referred to as the ST54L_SE). The ST54L_SE is in the scope of this evaluation, while the ST54L_CLF is out of scope of this evaluation.

Furthermore, the ST54L_SE features a MIFARE® Classic cryptographic accelerator called Crypto1, and two specific cryptographic accelerators called SM3 and SM4 which are all out of the scope of this evaluation.

In the following, the TOE is denoted by "ST54L A02" or "TOE".

Figure 1 provides an overview of the ST54L platform.

The ST54L A02 is a serial access microcontroller designed for secure mobile applications. It incorporates the most recent generation of Arm processors for embedded secure systems. Their Arm® Cortex® M35P 32-bit RISC core is built on the Cortex®-M33 core with additional security features to help to protect against advanced forms of attacks.

---

Table 1. TOE components

<table>
<thead>
<tr>
<th>IC Maskset name</th>
<th>IC version</th>
<th>Master identification number</th>
<th>Firmware version</th>
</tr>
</thead>
<tbody>
<tr>
<td>K450</td>
<td>C</td>
<td>0x0276</td>
<td>3.2.2</td>
</tr>
</tbody>
</table>

1. Part of the product information.

a. MIFARE and MIFARE Classic are trademarks of NXP B.V. and are used under license.
The ST54L A02 provides high performance thanks to a fast Cortex® M35P processor, crypto-accelerators and improved Flash memory operation.

Cadenced at 115 MHz, the Cortex® M35P core and its cache memory (4 Kbyte) bring great performance and excellent code density thanks to the Thumb®-2 instruction set.

Strong and multiple fault protection mechanisms ensure a guaranteed high-detection coverage that facilitates the development of highly secure software. This is achieved by using two CPUs in locked-step mode, error codes in sensitive memories and hardware logic.

Different derivative devices may be configured depending on the customer needs:

- either by ST during the manufacturing or packaging process,
- or by the customer during the packaging, composite product integration, or personalisation process.

The derivative devices all share the same hardware design and the same maskset (denoted by the Master identification number). The Master identification number is unique for all product configurations.

The configuration of the derivative devices is realized in Admin configuration, by ST or by the customer. It can impact the available NVM size, and the availability of the MIFARE accelerator, SM3 and SM4 accelerators, as detailed here below:

<table>
<thead>
<tr>
<th>Features</th>
<th>Possible values</th>
</tr>
</thead>
<tbody>
<tr>
<td>NVM size</td>
<td>3.3 Mbytes, 2.5 Mbytes or 2 Mbytes</td>
</tr>
<tr>
<td>MIFARE accelerator (out of scope)</td>
<td>Active, Inactive</td>
</tr>
<tr>
<td>SM3 accelerator (out of scope)</td>
<td>Active, Inactive</td>
</tr>
<tr>
<td>SM4 accelerator (out of scope)</td>
<td>Active, Inactive</td>
</tr>
</tbody>
</table>

All combinations of different features values are possible and covered by this certification. All possible configurations can vary under a unique IC, and without impact on security.

The Master identification number is unique for all product configurations. Each derivative device has a specific Child product identification number, also part of the product information, and specified in the Data Sheet and in the Firmware User Manual, referenced in Table 14.

The rest of this document applies to all possible configurations of the TOE, except when a restriction is mentioned. For easier reading, the restrictions are typeset as indicated here.
In a few words, the ST54L A02 offers a unique combination of high performances and very powerful features for high level security:

- Two instances of the Arm® Cortex® M35P CPU connected in Lockstep mode,
- Die integrity,
- Monitoring of environmental parameters,
- Highly efficient protection against faults,
- AIS20/AIS31 class PTG.2 compliant True Random Number Generator,
- Arm® Cortex® M35P Memory Management Function,
- ISO 13239 compatible CRC calculation block,
- Hardware Security Enhanced DES accelerator,
- Hardware Security AES accelerator,
- NExt Step CRYPTography accelerator (Nescrypt Fast)\(^{(b)}\) for public key cryptography algorithm.

### 1.6 TOE description

#### 1.6.1 TOE hardware description

The ST54L A02 features hardware accelerators for advanced cryptographic functions, with built-in countermeasures against side channel and fault attacks.

The AES (Advanced Encryption Standard \([3]\)) accelerator provides a high-performance implementation of AES-128, AES-192 and AES-256 algorithms. It can operate in Electronic Code Book (ECB) and Cipher Block Chaining (CBC) modes.

The 3-key triple DES accelerator (EDES+) supports efficiently the Triple Data Encryption Standard (TDES \([2]\)), enabling Electronic Code Book (ECB) and Cipher Block Chaining (CBC) modes, and triple DES computation. Note that a triple DES can be performed by a triple DES computation or by 3 single DES computations.

The Nescrypt Fast crypto-processor allows fast and secure implementation of the most popular public key cryptosystems with a high level of performance \((4), [6], [8],[9], [10], [11]\). It must be highlighted that Nescrypt provides only primitive operations, thus is not addressing any specific SFR of the present Security Target.

The TOE offers 100 Kbytes of User RAM and up to 3376 Kbytes of secure User high-density Flash memory (NVM). An Arm® memory management function (MMF) allows to use virtual addressing on these memories, and enables the user to define its own region organization with specific protection and access permissions. A Library Protection Unit (LPU) is available to isolate protected code (e.g. a library) from the rest of the code embedded in the device. The LPU may be reserved to ST, when a ST library requires its protection.

As randomness is a key stone in many applications, the TOE features a highly reliable True Random Number Generator (TRNG), compliant with PTG.2 Class of AIS20/AIS31 \([1]\) and directly accessible through dedicated registers.

The TOE also provides a 16- and 32-bit CRC calculation block (compliant to ISO 13239, IEEE 802.3, etc.).

\(^{(b)}\) Although in the scope of this evaluation, Nescrypt is not addressing any specific SFR in this Security Target.
The ST54L platform offers a serial communication interface fully compatible with the ISO/IEC 7816-3 standard (T=0, T=1) and a single-wire protocol (SWP) slave interface for communication with a near field communication (NFC) router in Secure Element applications.

Three I²C interfaces (one master/slave and two slave) are available as well as an SPI Master/Slave interface for communication in non-SIM applications.

Three general-purpose 16-bit timers as well as a watchdog timer, and a permanent timer are available.

The detailed features of this TOE are described in the Data Sheet, SE subsystem OS developer’s guide and in the Cortex® M35P Technical Reference Manual, referenced in Table 14.

Figure 2 provides an overview of the ST54L A02.

Figure 2. ST54L A02 block diagram

1.6.2 TOE software description

The OST ROM contains a Dedicated Software which provides full test capabilities (operating system for test, called "OST"), not accessible by the Security IC Embedded Software (ES), after TOE delivery.
The System ROM and ST NVM of the TOE contain a Dedicated Software (Firmware) which provides:

- a Secure Flash Loader, enabling to securely and efficiently download the Security IC Embedded Software (ES) into the NVM. It also allows the evaluator to load software into the TOE for test purpose. The Secure Flash Loader is available in Admin configuration. The customer can choose to activate it in any phase of the product life-cycle under highly secured conditions, or to deactivate it definitely at a certain step.
- low-level functions called Flash Drivers, enabling the Security IC Embedded Software (ES) to modify and manage the NVM contents. The Flash Drivers are available in User configuration.
- a set of protected commands for device testing and product profiling, not intended for the Security IC Embedded Software (ES) usage, and not available in User configuration.
- a very reduced set of uncritical commands for basic diagnostic purpose (field return analysis), only reserved to STMicroelectronics.
- a set of highly protected commands for secure diagnostic purpose (advanced quality investigations), that can only be activated by the customer and be operated by STMicroelectronics on its own audited sites. This feature is protected by specific strong access control, completed by environmental measures which prevent access to customer assets. Furthermore, it can be permanently deactivated by the customer.

The Security IC Embedded Software (ES) is in User NVM.

Note: The ES is not part of the TOE and is out of scope of the evaluation.

### 1.6.3 TOE documentation

The user guidance documentation, part of the TOE, consists of:

- the product Data Sheet,
- the SE subsystem OS developer’s guide,
- the Firmware user manual,
- the Arm Cortex® M35P Technical Reference Manual,
- the product family Security Guidance,
- the random number generation user manual,
- the TRNG reference implementation application note.

The complete list of guidance documents is detailed in Table 14.

### 1.6.4 Delivery format and method

The ST54L is delivered in packaged form, as described in the Data Sheet referenced in Table 14. It is shipped to the customer. The firmware is integrated on the IC before delivery.

All the guidance documents are delivered as ciphered pdf files, by email.

### 1.7 TOE life cycle

This Security Target is fully conform to the claimed PP. In the following, just a summary and some useful explanations are given. For complete details on the TOE life cycle, please refer
The composite product life cycle is decomposed into 7 phases. Each of these phases has the very same boundaries as those defined in the claimed protection profile.

Figure 3. Security IC Life-Cycle if Security IC Embedded Software is loaded by Security IC Dedicated Software into the programmable non-volatile Memory

The life cycle phases are summarized in Table 3.

The sites potentially involved in the TOE life cycle are listed in Table 15.

The limit of the evaluation corresponds to phases 2, 3 and 4, including the delivery and verification procedures of phase 1, and the TOE delivery to the composite product integrator; procedures corresponding to phases 1, 5, 6 and 7 are outside the scope of this evaluation.

In the following, the term "Composite product manufacturing" is uniquely used to indicate phases 1, 5 and 6 all together. This ST also uses the term "Composite product manufacturer" which includes all roles responsible of the TOE during phases 1, 5 and 6.

The TOE is delivered after phase 4 in packaged form.
In the following, the term "TOE delivery" is uniquely used to indicate after phase 4 (or before phase 5).

The TOE is delivered in Admin (aka Issuer) or User configuration.

### 1.8 TOE environment

Considering the TOE, three types of environments are defined:
- Development environment corresponding to phase 2,
- Production environment corresponding to phase 3 and 4,
- Operational environment, including phase 1 and from phase 5 to phase 7.

#### 1.8.1 TOE Development Environment

To ensure security, the environment in which the development takes place is secured with controllable accesses having traceability. Furthermore, all authorized personnel involved fully understand the importance and the strict implementation of defined security procedures.

The development begins with the TOE's specification. All parties in contact with sensitive information are required to abide by Non-Disclosure Agreements.

Design and development of the IC then follows, together with the dedicated and engineering software and tools development. The engineers use secure computer systems (preventing unauthorized access) to make their developments, simulations, verifications and generation of the TOE's databases. Sensitive documents, files and tools, databases on tapes, and printed circuit layout information are stored in appropriate locked cupboards/safe. Of paramount importance also is the disposal of unwanted data (complete electronic erasures) and documents (e.g. shredding).
The development centres possibly involved in the development of the TOE are denoted by the activity “DEV” in Table 15.

The IT support centers potentially involved in the development of the TOE are denoted by the activity "IT" in Table 15.

1.8.2 TOE production environment

Reticules and photomasks are generated from the verified IC databases; the former are used in the silicon Wafer-fab processing. As reticules and photomasks are generated off-site, they are transported and worked on in a secure environment. During the transfer of sensitive data electronically, procedures are established to ensure that the data arrive only at the destination and are not accessible at intermediate stages (e.g. stored on a buffer server where system administrators make backup copies).

The authorized sub-contractors potentially involved in the TOE mask manufacturing are denoted by the activity “MASK” in Table 15.

As high volumes of product commonly go through such environments, adequate control procedures are necessary to account for all product at all stages of production.

Production starts within the Wafer-fab; here the silicon wafers undergo the diffusion processing. Computer tracking at wafer level throughout the process is commonplace. The wafers are then taken into the test area. Testing and pre-personalization of each TOE occurs to assure conformance with the device specification and to load the customer information.

The authorized front-end plant possibly involved in the manufacturing of the TOE are denoted by the activity “FE” in Table 15.

The authorized EWS plant potentially involved in the testing of the TOE are denoted by the activity “EWS” in Table 15.

Wafers are then scribed and broken such as to separate the functional from the non-functional ICs. The latter is discarded in a controlled accountable manner. The good ICs are then packaged in phase 4, in a back-end plant. When testing, programming or deliveries are done offsite, ICs are transported and worked on in a secure environment with accountability and traceability of all (good and bad) products.

The authorized back-end plants possibly involved in the packaging of the TOE are denoted by the activity “BE” in Table 15.

All sites denoted by the activity “WHS” and “WHSD” in Table 15 can be involved for the logistics.

1.8.3 TOE operational environment

A TOE operational environment is the environment of phases 1, then 5 to 7.

At phases 1, 5 and 6, the TOE operational environment is a controlled environment.

End-user environments (phase 7): composite products are used in a wide range of applications to assure authorized conditional access. The ST54L platform products specifically target mobile devices, wearable, smart watch and secure connected devices. The end-user environment therefore covers a wide range of very different functions, thus making it difficult to avoid and monitor any abuse of the TOE.
Conformance claims (ASE_CCL, ASE_ECD)

2.1 Common Criteria conformance claims

The ST54L A02 Security Target claims to be conformant to the Common Criteria version 3.1 revision 5.

Furthermore it claims to be CC Part 2 (CCMB-2017-04-002 R5) extended and CC Part 3 (CCMB-2017-04-003 R5) conformant.

The extended Security Functional Requirements are those defined in the Eurosmart - Security IC Platform Protection Profile with Augmentation Packages (BSI-CC-PP-0084-2014):

- **FCS_RNG** Generation of random numbers,
- **FMT_LIM** Limited capabilities and availability,
- **FAU_SAS** Audit data storage,
- **FDP_SDC** Stored data confidentiality,
- **FIA_API** Authentication proof of identity.

The reader can find their certified definitions in the text of the "BSI-CC-PP-0084-2014" Protection Profile.

The assurance level for the ST54L A02 Security Target is EAL6 augmented by ALC_FLR.2.

2.2 PP Claims:

2.2.1 PP Reference

The ST54L A02 Security Target claims strict conformance to the Eurosmart - Security IC Platform Protection Profile with Augmentation Packages (BSI-CC-PP-0084-2014), as required by this Protection Profile.

The following packages have been selected from the BSI-CC-PP-0084-2014:

- Package “Authentication of the Security IC”,
- Packages for Loader:
  - Package 1: Loader dedicated for usage in Secured Environment only,
  - Package 2: Loader dedicated for usage by authorized users only.

2.2.2 PP Additions

The main additions operated on the BSI-CC-PP-0084-2014 are:

- Addition #4: “Area based Memory Access Control” from AUG,
- Addition #1: “Support of Cipher Schemes” from AUG,
- Specific additions for the Loader, to comply with JIL-Post-Deliv-Load and ANSSI-CC-CER/F/06.003,
- Specific additions for the Secure Diagnostic capability,
- Refinement of assurance requirements.

All refinements are indicated with type setting text as indicated here, original text from the BSI-CC-PP-0084-2014 being typeset as indicated here. Text originating in AUG is typeset
The security environment additions relative to the PP are summarized in Table 4.
The additional security objectives relative to the PP are summarized in Table 5.
A simplified presentation of the TOE Security Policy (TSP) is added.
The additional SFRs for the TOE relative to the PP are summarized in Table 7.
The additional SARs relative to the PP are summarized in Table 9.

2.2.3 PP Claims rationale

The differences between this Security Target security objectives and requirements and those of BSI-CC-PP-0084-2014, to which conformance is claimed, have been identified and justified in Section 4 and in Section 5. They have been recalled in the previous section.

In the following, the statements of the security problem definition, the security objectives, and the security requirements are consistent with those of the BSI-CC-PP-0084-2014.

The security problem definition presented in Section 3, clearly shows the additions to the security problem statement of the PP.

The security objectives rationale presented in Section 4.3 clearly identifies modifications and additions made to the rationale presented in the BSI-CC-PP-0084-2014.

Similarly, the security requirements rationale presented in Section 5.4 has been updated with respect to the protection profile.

All PP requirements have been shown to be satisfied in the extended set of requirements whose completeness, consistency and soundness have been argued in the rationale sections of the present document.
3 Security problem definition (ASE_SPD)

This section describes the security aspects of the environment in which the TOE is intended to be used and addresses the description of the assets to be protected, the threats, the organisational security policies and the assumptions.

Note that the origin of each security aspect is clearly identified in the prefix of its label. Most of these security aspects can therefore be easily found in the Eurosmart - Security IC Platform Protection Profile with Augmentation Packages (BSI-CC-PP-0084-2014), section 3. Only those originating in AUG or in JIL-Post-Deliv-Load / ANSSI-CC-CER/F/06.003, and the ones introduced in this Security Target, are detailed in the following sections.

A summary of all these security aspects and their respective conditions is provided in Table 4.

Table 4. Summary of security aspects

3.1 Description of assets

100 Since this Security Target claims strict conformance to the *Eurosmart - Security IC Platform Protection Profile with Augmentation Packages (BSI-CC-PP-0084-2014)*, the assets defined in section 3.1 of the Protection Profile are applied and the assets regarding threats are clarified in this Security Target.

101 The assets (related to standard functionality) to be protected are:
- the user data of the Composite TOE,
- the Security IC Embedded Software, stored and in operation,
- the security services provided by the TOE for the Security IC Embedded Software.

102 The user (consumer) of the TOE places value upon the assets related to high-level security concerns:
- SC1 integrity of user data of the Composite TOE,
- SC2 confidentiality of user data of the Composite TOE being stored in the TOE’s protected memory areas,
- SC3 correct operation of the security services provided by the TOE for the Security IC Embedded Software.

Note the Security IC Embedded Software is user data and shall be protected while being executed/processed and while being stored in the TOE’s protected memories.

103 The Security IC may not distinguish between user data which is public knowledge or kept confidential. Therefore the security IC shall protect the user data of the Composite TOE in integrity and in confidentiality if stored in protected memory areas, unless the Security IC Embedded Software chooses to disclose or modify it.

104 In particular integrity of the Security IC Embedded Software means that it is correctly being executed which includes the correct operation of the TOE’s functionality. Parts of the Security IC Embedded Software which do not contain secret data or security critical source code, may not require protection from being disclosed. Other parts of the Security IC Embedded Software may need to be kept confidential since specific implementation details may assist an attacker.

105 The Protection Profile requires the TOE to provide at least one security service: the generation of random numbers by means of a physical Random Number Generator. The annex 7 provides packages for typical additional security services. The Security Target may require additional security services as described in these packages or define TOE specific security services. It is essential that the TOE ensures the correct operation of all security services provided by the TOE for the Security IC Embedded Software.

106 According to the Protection Profile there is the following high-level security concern related to security service:
- SC4 deficiency of random numbers.

107 To be able to protect these assets (SC1 to SC4) the TOE shall self-protect its TSF. Critical information about the TSF shall be protected by the development environment and the operational environment. Critical information may include:
- logical design data, physical design data, IC Dedicated Software, and configuration data,
- initialisation Data and Pre-personalisation Data, specific development aids, test and characterisation related data, material for software development support, and photomasks.
Such information and the ability to perform manipulations assist in threatening the above assets.

Note that there are many ways to manipulate or disclose the user data of the Composite TOE: (i) An attacker may manipulate the Security IC Embedded Software or the TOE. (ii) An attacker may cause malfunctions of the TOE or abuse Test Features provided by the TOE. Such attacks usually require design information of the TOE to be obtained. They pertain to all information about (i) the circuitry of the IC (hardware including the physical memories), (ii) the IC Dedicated Software with the parts IC Dedicated Test Software (if any) and IC Dedicated Support Software (if any), and (iii) the configuration data for the TSF. The knowledge of this information may enable or support attacks on the assets. Therefore the TOE Manufacturer must ensure that the development and production of the TOE (refer to Section 1.2.3) is secure so that no restricted, sensitive, critical or very critical information is unintentionally made available for attacks in the operational phase of the TOE (cf. [8] for details on assessment of knowledge of the TOE in the vulnerability analysis).

ST must apply protection to support the security of the TOE. This not only pertains to the TOE but also to all information and material exchanged with the developer of the Security IC Embedded Software. This covers the Security IC Embedded Software itself if provided by the developer of the Security IC Embedded Software or any authentication data required to enable the download of software. This includes the delivery (exchange) procedures for Phase 1 and the Phases after TOE Delivery as far as they can be controlled by the TOE Manufacturer. These aspects enforce the usage of the supporting documents and the refinements of SAR defined in the protection profile.

The information and material produced and/or processed by ST in the TOE development and production environment (Phases 2 up to TOE Delivery) can be grouped as follows:
- logical design data,
- physical design data,
- IC Dedicated Software, Initialisation Data and Pre-personalisation Data,
- Security IC Embedded Software, provided by the Security IC Embedded Software developer and implemented by the IC manufacturer,
- specific development aids,
- test and characterisation related data,
- material for software development support, and
- photomasks and products in any form as long as they are generated, stored, or processed by ST.

Application note:
The TOE providing a functionality for Security IC Embedded Software secure loading into NVM, the ES is considered as User Data being stored in the TOE's memories at this step, and the Protection Profile corresponding packages are integrated, as well as the requirements from JIL-Post-Deliv-Load.

3.2 Threats

The threats are described in the BSI-CC-PP-0084-2014, section 3.2. Only those originating in AUG and ANSSI-CC-CER/F/06.003, and the ones introduced in this ST are detailed in the following section.

<td>Memory Access Violation: Parts of the Security IC Embedded Software may cause security violations by accidentally or deliberately accessing restricted data (which may include code). Any restrictions are defined by the security policy of the specific application context and must be implemented by the Security IC Embedded Software. Clarification: This threat does not address the proper definition and management of the security rules implemented by the Security IC Embedded Software, this being a software design and correctness issue. This threat addresses the reliability of the abstract machine targeted by the software implementation. To avert the threat, the set of access rules provided by this TOE should be undefeated if operated according to the provided guidance. The threat is not realized if the Security IC Embedded Software is designed or implemented to grant access to restricted information. It is realized if an implemented access denial is granted under unexpected conditions or if the execution machinery does not effectively control a controlled access. Here the attacker is expected to (i) take advantage of flaws in the design and/or the implementation of the TOE JILmemory access rules (refer to BSI.T.Abuse-Func but for functions available after TOE delivery), (ii) introduce flaws by forcing operational conditions (refer to BSI.T.Malfunction) and/or by physical manipulation (refer to BSI.T.Phys-Manipulation). This attacker is expected to have a high level potential of attack.</td>
</tr>
</tbody>
</table>
3.3 Organisational security policies

The TOE provides specific security functionality that can be used by the Security IC Embedded Software. In the following specific security functionality is listed which is not derived from threats identified for the TOE’s environment because it can only be decided in
the context of the Security IC application, against which threats the Security IC Embedded Software will use the specific security functionality.

115 ST applies the Protection policy during TOE Development and Production (BSI.P.Process-TOE) as specified below.

116 BSI.P.Lim-Block-Loader and BSI.P.Ctrl-Loader are dedicated to the Secure Flash Loader, and described in the BSI-CC-PP-0084-2014 packages “Loader dedicated for usage in secured environment only” and “Loader dedicated for usage by authorized users only”. BSI.P.Ctrl-Loader has been completed in accordance with JIL-Post-Deliv-Load.

117 ST applies the Additional Specific Security Functionality policy (AUG1.P.Add-Functions) as specified below.

New Organisational Security Policies (OSPs) are defined here below:

BSI.P.Process-TOE Identification during TOE Development and Production:

An accurate identification is established for the TOE. This requires that each instantiation of the TOE carries this unique identification.

BSI.P.Lim-Block-Loader Limiting and blocking the loader functionality:

The composite manufacturer uses the Loader for loading of Security IC Embedded Software, user data of the Composite Product or IC Dedicated Support Software in charge of the IC Manufacturer. He limits the capability and blocks the availability of the Loader(1) in order to protect stored data from disclosure and manipulation.

1. Note that blocking the Loader is not required, as only authorized users can use the Loader as stated in BSI.P.Ctrl-Loader.

BSI.P.Ctrl-Loader Controlled usage to Loader Functionality:

Authorized user controls the usage of the Loader functionality in order to protect stored and loaded user data from disclosure and manipulation.

The activation of the loaded Additional Code user data is possible if:

– integrity and authenticity of the Additional Code user data have been successfully checked by the initial TOE;

– the loaded Additional Code user data is targeted to the Initial TOE (Identification Data of the Additional Code user data and the Initial TOE will be used for this check).

Identification Data of the resulting Final TOE shall identify the Initial TOE and the activated Additional Code user data.

Identification Data shall be protected in integrity.

Note: Here, the term TOE denotes the TOE itself as well as the composite TOE which both may be maintained by loading of data.
The TOE shall provide the following specific security functionality to the Security IC Embedded Software:
- Triple Data Encryption Standard (TDES)\(^{(1)}\)
- Advanced Encryption Standard (AES).

1. Note that DES and triple DES with two keys are no longer recommended as encryption functions in the context of smart card applications. Hence, Security IC Embedded Software may need to use triple DES with three keys to achieve a suitable strength.

3.4 Assumptions

The following assumptions are described in the \textit{BSI-CC-PP-0084-2014}, section 3.4.

\begin{itemize}
\item [BSI.A.Process-Sec-IC] Protection during Packaging, Finishing and Personalisation
\item [BSI.A.Resp-Appl] Treatment of User Data of the Composite TOE
\end{itemize}
The security objectives of the TOE cover principally the following aspects:

- Integrity and confidentiality of assets,
- Protection of the TOE and associated documentation during development and production phases,
- Provide random numbers,
- Provide cryptographic support and access control functionality.

A summary of all security objectives is provided in Table 5.

Note that the origin of each objective is clearly identified in the prefix of its label. Most of these security aspects can therefore be easily found in the BSI-CC-PP-0084-2014, sections 4.1 and 7.3. Only those which have been amended, those originating in AUG, those originating in JIL-Post-Deliv-Load, and the ones introduced in this Security Target, are detailed in the following sections.

4.1 Security objectives for the TOE

- BSI.O.Leak-Inherent: Protection against Inherent Information Leakage
- BSI.O.Phys-Probing: Protection against Physical Probing
- BSI.O.Malfunction: Protection against Malfunctions
- BSI.O.Phys-Manipulation: Protection against Physical Manipulation
- BSI.O.Leak-Forced: Protection against Forced Information Leakage
- BSI.O.Abuse-Func: Protection against Abuse of Functionality
- BSI.O.Identification: TOE Identification
- BSI.O.RND: Random Numbers
- BSI.O.Cap-Avail-Loader: Capability and Availability of the Loader
- BSI.O.Ctrl-Auth-Loader: Access control and authenticity for the Loader
- BSI.O.Authentication: Authentication to external entities
- JIL.O.Prot-TSF-Confidentiality: Protection of the confidentiality of the TSF:
  The TOE must provide protection against disclosure of confidential operations of the Security IC (loader, memory management unit, ...) through the use of a dedicated code loaded on open samples.
JIL.O.Secure-Load-ACode Secure loading of the Additional Code:

The Loader of the Initial TOE shall check an evidence of authenticity and integrity of the loaded Additional Code. The Loader enforces that only the allowed version of the Additional Code can be loaded on the Initial TOE. The Loader shall forbid the loading of an Additional Code not intended to be assembled with the Initial TOE. During the Load Phase of an Additional Code, the TOE shall remain secure.

Note: Concretely, the TOE manages the Additional Code as a Memory Image.

JIL.O.Secure-AC-Activation Secure activation of the Additional Code:

Activation of the Additional Code and update of the Identification Data shall be performed at the same time in an Atomic way.

All the operations needed for the code to be able to operate as in the Final TOE shall be completed before activation.

If the Atomic Activation is successful, then the resulting product is the Final TOE, otherwise (in case of interruption or incident which prevents the forming of the Final TOE such as tearing, integrity violation, error case…), the Initial TOE shall remain in its initial state or fail secure.

JIL.O.TOE-Identification Secure identification of the TOE:

The Identification Data identifies the Initial TOE and Additional Code. The TOE provides means to store Identification Data in its non-volatile memory and guarantees the integrity of these data.

After Atomic Activation of the Additional Code, the Identification Data of the Final TOE allows identifications of Initial TOE and Additional code. The user shall be able to uniquely identify Initial TOE and Additional Code(s) which are embedded in the Final TOE.

O.Secure-Load-AMemImage Secure loading of the Additional Memory Image:

The Loader of the TOE shall check an evidence of authenticity and integrity of the loaded Memory Image.

The Loader enforces that only the allowed version of the Additional Memory Image can be loaded after the Initial Memory Image. The Loader shall forbid the loading of an Additional Memory Image not intended to be assembled with the Initial Memory Image.

Note: This objective is similar to JIL.O.Secure-Load-ACode, applied to user data (e.g. embedded software).
O.MemImage-Identification Secure identification of the Memory Image:

The Identification Data identifies the Initial Memory Image and Additional Memory Image. The TOE provides means to store Identification Data in its non-volatile memory and guarantees the integrity of these data. Storage of the Additional Memory Image and update of the Identification Data shall be performed at the same time in an Atomic way, otherwise (in case of interruption or incident which prevents this alignment), the Memory Image shall remain in its initial state or the TOE shall fail secure.

The Identification Data of the Final Memory Image allows identifications of Initial Memory Image and Additional Memory Image. Note: This objective is similar to JIL.O.Secure-AC-Activation and JIL.O.TOE-Identification, applied to user data (e.g. embedded software).

AUG1.O.Add-Functions Additional Specific Security Functionality:

The TOE shall provide the following specific security functionality to the Security IC Embedded Software:
- Triple Data Encryption Standard (TDES),
- Advanced Encryption Standard (AES).

AUG4.O.Mem-Access Dynamic Area based Memory Access Control:

The TOE must provide the Security IC Embedded Software with the capability to define dynamic memory segmentation and protection. The TOE must then enforce the defined access rules so that access of software to memory areas is controlled as required, for example, in a multi-application environment.

O.Firewall Specific application firewall:

The TOE shall ensure isolation of data and code between a specific application and the other applications. An application shall not read, write, compare any piece of data or code belonging to the specific application.

4.2 Security objectives for the environment

Security Objectives for the Security IC Embedded Software development environment (phase 1):

BSI.OE.Resp-Appl Treatment of User Data of the Composite TOE

Security Objectives for the operational Environment (phase 5 to 7):
<table>

<td></td>
<td></td>
</tr>
</tbody>
</table>
4.3 Security objectives rationale

The main line of this rationale is that the inclusion of all the security objectives of the BSI-CC-PP-0084-2014 protection profile, together with those in AUG, and those introduced in this ST, guarantees that all the security environment aspects identified in Section 3 are addressed by the security objectives stated in this chapter.

Thus, it is necessary to show that:
- security environment aspects from AUG and from this ST, are addressed by security objectives stated in this chapter,
- security objectives from AUG and from this ST, are suitable (i.e. they address security environment aspects),
- security objectives from AUG and from this ST, are consistent with the other security objectives stated in this chapter (i.e. no contradictions).

The selected augmentations from AUG introduce the following security environment aspects:
- TOE threat "Memory Access Violation, (AUG4.T.Mem-Access)",
- organisational security policy "Additional Specific Security Functionality, (AUG1.P.Add-Functions)".

The augmentation made in this ST introduces the following security environment aspect:
- TOE threats "Diffusion of open samples, (JIL.T.Open-Samples-Diffusion)", "Specific application code confidentiality, (T.Confid-Applic-Code)", " Specific application data confidentiality, (T.Confid-Applic-Data)", " Specific application code integrity, (T.Integ-Applic-Code)", "Specific application data integrity, (T.Integ-Applic-Data)".

The justification of the additional threat provided in the next subsections shows that it does not contradict to the rationale already given in the protection profile BSI-CC-PP-0084-2014 for the assumptions, policies and threats defined there.

</tr>
</tbody>
</table>
4.3.1 TOE threat "Abuse of Functionality"

The justification related to the threat “Abuse of Functionality, (BSI.T.Abuse-Func)” is as follows:

The threat BSI.T.Abuse-Func is directly covered by the security objective BSI.O.Abuse-Func, supported by the security objectives for the operational environment OE.Enable-Disable-Secure-Diag and OE.Secure-Diag-Usage for the particular case of the Secure Diagnostic. Therefore BSI.T.Abuse-Func is covered by these three objectives.

4.3.2 TOE threat "Memory Access Violation"

The justification related to the threat "Memory Access Violation, (AUG4.T.Mem-Access)" is as follows:

According to AUG4.O.Mem-Access the TOE must enforce the dynamic memory segmentation and protection so that access of software to memory areas is controlled. Any restrictions are to be defined by the Security IC Embedded Software. Thereby security violations caused by accidental or deliberate access to restricted data (which may include code) can be prevented (refer to AUG4.T.Mem-Access). The threat AUG4.T.Mem-Access is therefore removed if the objective is met.

The added objective for the TOE AUG4.O.Mem-Access does not introduce any contradiction in the security objectives for the TOE.

4.3.3 TOE threat "Diffusion of open samples"

The justification related to the threat "Diffusion of open samples, (JIL.T.Open-Samples-Diffusion)" is as follows:

According to threat JIL.T.Open-Samples-Diffusion, the TOE shall provide protection against attacks using open samples of the TOE to characterize the behavior of the IC and its security functionalities. The objective JIL.O.Prot-TSF-Confidentiality requires protection against disclosure of confidential operations of the Security IC through the use of a dedicated code loaded on open samples. Additionally, BSI.O.Leak-Inherent and BSI.O.Leak-Forced ensures protection against disclosure of confidential data processed in the Security IC. Therefore JIL.T.Open-Samples-Diffusion is covered by these three objectives.

The added objective for the TOE JIL.O.Prot-TSF-Confidentiality does not introduce any contradiction in the security objectives for the TOE.

4.3.4 TOE threat "Specific application code confidentiality"

The justification related to the threat “Specific application code confidentiality, (T.Confid-Applic-Code)” is as follows:

Since O.Firewall requires that the TOE ensures isolation of code between a specific application and the other applications, the code of the specific application is protected against unauthorised disclosure, therefore T.Confid-Applic-Code is covered by O.Firewall.

The added objective for the TOE O.Firewall does not introduce any contradiction in the security objectives for the TOE.
4.3.5 TOE threat "Specific application data confidentiality"

The justification related to the threat “Specific application data confidentiality, (T.Confid-Applic-Data)” is as follows:

Since O.Firewall requires that the TOE ensures isolation of data between a specific application and the other applications, the data of the specific application is protected against unauthorised disclosure, therefore T.Confid-Applic-Data is covered by O.Firewall.

4.3.6 TOE threat "Specific application code integrity"

The justification related to the threat “Specific application code integrity, (T.Integ-Applic-Code)” is as follows:

The threat is related to the alteration of a specific application code by an attacker. O.Firewall requires that the TOE ensures isolation of code between the specific application and the other applications, thus protecting the code of the specific application against unauthorised modification. Therefore the threat is covered by O.Firewall.

4.3.7 TOE threat "Specific application data integrity"

The justification related to the threat “Specific application data integrity, (T.Integ-Applic-Data)” is as follows:

The threat is related to the alteration of a specific application data by an attacker. Since O.Firewall requires that the TOE ensures complete isolation of data between the specific application and the other applications, the data of the specific application is protected against unauthorised modification, therefore T.Integ-Applic-Data is covered by O.Firewall.

4.3.8 Organisational security policy "Controlled usage to Loader Functionality"

The justification related to the organisational security policy "Controlled usage to Loader Functionality, (BSI.P.Ctrl-Loader)” is as follows:

As stated in BSI-CC-PP-0084-2014, the organisational security policy “Controlled usage to Loader Functionality (BSI.P.Ctrl-Loader)” is implemented by the security objective for the TOE “Access control and authenticity for the Loader (BSI.O.Ctrl-Auth-Loader)” and the security objective for the TOE environment “Secure communication and usage of the Loader (BSI.OE.Loader-Usage)”.

The security objectives “Secure loading of the Additional Code (JIL.O.Secure-Load-ACode)”, “Secure activation of the Additional Code (JIL.O.Secure-AC-Activation)”, and “Secure identification of the TOE (JIL.O.TOE-Identification)” specified by JIL-Post-Deliv-Load additionally enforce this policy since they require authenticity, atomicity, identification of the loaded additional code, part of the TOE. “Secure identification of the TOE (JIL.O.TOE-Identification)” is supported by the security objective for the TOE environment “TOE identification (OE.TOE-Id)”.

Similarly, the security objectives “Secure loading of the Additional Memory Image (O.Secure-Load-AMemImage)”, and “Secure identification of the Memory Image (O.MemImage-Identification)”, enforce this policy since they require authenticity, atomicity, identification of the loaded additional memory image for the user data (embedded software). "Secure identification of Memory Image (O.MemImage-Identification)" is supported by the security objective for the TOE environment “Composite TOE identification (OE.Composite-TOE-Id)”. Therefore the policy is covered by these nine objectives.
4.3.9 Organisational security policy "Additional Specific Security Functionality"

149 The justification related to the organisational security policy "Additional Specific Security Functionality, \( (AUG1.P.Add-Functions) \)" is as follows:

150 Since \( AUG1.O.Add-Functions \) requires the TOE to implement exactly the same specific security functionality as required by \( AUG1.P.Add-Functions \), \textbf{and in the very same conditions}, the organisational security policy is covered by the objective.

151 Nevertheless the security objectives \( BSI.O.Leak-Inherent, BSI.O.Phys-Probing, BSI.O.Malfunction, BSI.O.Phys-Manipulation \) and \( BSI.O.Leak-Forced \) define how to implement the specific security functionality required by \( AUG1.P.Add-Functions \). (Note that these objectives support that the specific security functionality is provided in a secure way as expected from \( AUG1.P.Add-Functions \).) Especially \( BSI.O.Leak-Inherent \) and \( BSI.O.Leak-Forced \) refer to the protection of confidential data (User Data or TSF data) in general. User Data are also processed by the specific security functionality required by \( AUG1.P.Add-Functions \).

152 The added objective for the TOE \( AUG1.O.Add-Functions \) does not introduce any contradiction in the security objectives for the TOE.
5 Security requirements (ASE_REQ)

This chapter on security requirements contains a section on security functional requirements (SFRs) for the TOE (Section 5.1), a section on security assurance requirements (SARs) for the TOE (Section 5.2), a section on the refinements of these SARs (Section 5.3) as required by the "BSI-CC-PP-0084-2014" Protection Profile. This chapter includes a section with the security requirements rationale (Section 5.4).

5.1 Security functional requirements for the TOE

Security Functional Requirements (SFRs) from the "BSI-CC-PP-0084-2014" Protection Profile (PP) are drawn from CCMB-2017-04-002 R5, except the following SFRs, that are extensions to CCMB-2017-04-002 R5:

- FCS_RNG Generation of random numbers,
- FMT_LIM Limited capabilities and availability,
- FAU_SAS Audit data storage,
- FDP_SDC Stored data confidentiality,
- FIA_API Authentication proof of identity.

The reader can find their certified definitions in the text of the "BSI-CC-PP-0084-2014" Protection Profile.

All extensions to the SFRs of the "BSI-CC-PP-0084-2014" Protection Profile (PP) are exclusively drawn from CCMB-2017-04-002 R5.

All iterations, assignments, selections, or refinements on SFRs have been performed according to section C.4 of CCMB-2017-04-001 R5. They are easily identified in the following text as they appear as indicated here. Note that in order to improve readability, iterations are sometimes expressed within tables.

In order to ease the definition and the understanding of these security functional requirements, a simplified presentation of the TOE Security Policy (TSP) is given in the following section.

The selected security functional requirements for the TOE, their respective origin and type are summarized in Table 7.

Lack of TOE identification

Correct Loader operation

Security Target Operated

Extended
5.1.1 Security Functional Requirements from the Protection Profile

Limited fault tolerance (FRU FLT.2)

The TSF shall ensure the operation of all the TOE’s capabilities when the following failures occur: exposure to operating conditions which are not detected according to the requirement Failure with preservation of secure state (FPT_FLS.1).

Refinement:
The term “failure” above means “circumstances”. The TOE prevents failures for the “circumstances” defined above.

Failure with preservation of secure state (FPT_FLS.1)

The TSF shall preserve a secure state when the following types of failures occur: exposure to operating conditions which may not be tolerated according to the requirement Limited fault tolerance (FRU FLT.2) and where therefore a malfunction could occur.

Refinements:
The term “failure” above also covers “circumstances”. The TOE prevents failures for the “circumstances” defined above. Regarding application note 14 of BSI-CC-PP-0084-2014, the secure state is reached by an immediate interrupt or by a reset, depending on the current context. Regarding application note 15 of BSI-CC-PP-0084-2014, the TOE provides information on the operating conditions monitored during Security IC Embedded Software execution and after a warm reset. No audit requirement is however selected in this Security Target.

Limited capabilities (FMT_LIM.1) / Test

The TSF shall be designed and implemented in a manner that limits their capabilities so that in conjunction with “Limited availability (FMT_LIM.2)” the following policy is enforced: Limited capability and availability Policy / Test.
Limited availability (FMT_LIM.2) / Test

164 The TSF shall be designed and implemented in a manner that limits their availability so that in conjunction with “Limited capabilities (FMT_LIM.1) / Test” the following policy is enforced: Limited capability and availability Policy / Test.

165 SFP_1: Limited capability and availability Policy / Test

Deploying Test Features after TOE Delivery does not allow User Data of the Composite TOE to be disclosed or manipulated, TSF data to be disclosed or manipulated, software to be reconstructed and no substantial information about construction of TSF to be gathered which may enable other attacks.

Audit storage (FAU_SAS.1)

166 The TSF shall provide the test process before TOE Delivery with the capability to store the Initialisation Data and/or Pre-personalisation Data and/or supplements of the Security IC Embedded Software in the NVM.

 Stored data confidentiality (FDP_SDC.1)

167 The TSF shall ensure the confidentiality of the information of the user data while it is stored in all the memory areas where it can be stored.

 Stored data integrity monitoring and action (FDP_SDI.2)

168 The TSF shall monitor user data stored in containers controlled by the TSF for integrity errors on all objects, based on the following attributes: user data stored in all possible memory areas, depending on the integrity control attributes.

169 Upon detection of a data integrity error, the TSF shall signal the error and react.

Resistance to physical attack (FPT_PHP.3)

170 The TSF shall resist physical manipulation and physical probing, to the TSF by responding automatically such that the SFRs are always enforced.

171 Refinement:
The TSF will implement appropriate mechanisms to continuously counter physical manipulation and physical probing. Due to the nature of these attacks (especially manipulation) the TSF can by no means detect attacks on all of its elements. Therefore, permanent protection against these attacks is required ensuring that security functional requirements are enforced. Hence, “automatic response” means here (i) assuming that there might be an attack at any time and (ii) countermeasures are provided at any time.

Basic internal transfer protection (FDP_ITT.1)

172 The TSF shall enforce the Data Processing Policy to prevent the disclosure of user data when it is transmitted between physically-separated parts of the TOE.

 Basic internal TSF data transfer protection (FPT_ITT.1)

173 The TSF shall protect TSF data from disclosure when it is transmitted between separate parts of the TOE.

174 Refinement:
The different memories, the CPU and other functional units of the TOE (e.g. a cryptographic co-processor) are seen as separated parts of the TOE.

This requirement is equivalent to FDP_ITT.1 above but refers to TSF data instead of User Data. Therefore, it should be understood as to refer to the same Data Processing Policy defined under FDP_IFC.1 below.

**Subset information flow control (FDP_IFC.1)**

175 The TSF shall enforce the *Data Processing Policy* on all confidential data when they are processed or transferred by the TOE or by the Security IC Embedded Software.

176 **SFP 2: Data Processing Policy**  
User Data of the Composite TOE and TSF data shall not be accessible from the TOE except when the Security IC Embedded Software decides to communicate the User Data via an external interface. The protection shall be applied to confidential data only but without the distinction of attributes controlled by the Security IC Embedded Software.

**Random number generation (FCS_RNG.1)**

177 The TSF shall provide a *physical* random number generator that implements:

- *(PTG.2.1)* A total failure test detects a total failure of entropy source immediately when the RNG has started. When a total failure is detected, no random numbers will be output.

- *(PTG.2.2)* If a total failure of the entropy source occurs while the RNG is being operated, the RNG prevents the output of any internal random number that depends on some raw random numbers that have been generated after the total failure of the entropy source.

- *(PTG.2.3)* The online test shall detect non-tolerable statistical defects of the raw random number sequence (i) immediately when the RNG has started, and (ii) while the RNG is being operated. The TSF must not output any random numbers before the power-up online test has finished successfully or when a defect has been detected.

- *(PTG.2.4)* The online test procedure shall be effective to detect non-tolerable weaknesses of the random numbers soon.

- *(PTG.2.5)* The online test procedure checks the quality of the raw random number sequence. It is triggered externally. The online test is suitable for detecting non-tolerable statistical defects of the statistical properties of the raw random numbers within an acceptable period of time.

178 The TSF shall provide *octets of bits* that meet

- *(PTG.2.6)* Test procedure A does not distinguish the internal random numbers from output sequences of an ideal RNG.

- *(PTG.2.7)* The average Shannon entropy per internal random bit exceeds 0.997.

### 5.1.2 Additional Security Functional Requirements for the cryptographic services

**Cryptographic operation (FCS_COP.1)**

179 The TSF shall perform *the operations in Table 8* in accordance with a specified cryptographic algorithm *in Table 8* and cryptographic key sizes *of Table 8* that meet the *standards in Table 8*. 
### 5.1.3 Additional Security Functional Requirements for the memories protection

The following SFRs are extensions to "BSI-CC-PP-0084-2014" Protection Profile (PP), related to the memories protection.

#### Static attribute initialisation (FMT_MSA.3) / Memories

The TSF shall enforce the Dynamic Memory Access Control Policy to provide *minimally protective* default values for security attributes that are used to enforce the SFP.

The TSF shall allow *none* to specify alternative initial values to override the default values when an object or information is created.

Application note:

The security attributes are the set of access rights currently defined. They are dynamically attached to the subjects and objects locations, i.e. each logical address.

#### Management of security attributes (FMT_MSA.1) / Memories

The TSF shall enforce the Dynamic Memory Access Control Policy to restrict the ability to *modify* the security attributes *current set of access rights* to *software having the needed clearance*.

#### Complete access control (FDP_ACC.2) / Memories

The TSF shall enforce the Dynamic Memory Access Control Policy on *all subjects (software), all objects (data including code stored in memories)* and all operations among subjects and objects covered by the SFP.

---

1. Note that DES and triple DES with two keys are no longer recommended as encryption functions in the context of smart card applications. Hence, Security IC Embedded Software may need to use triple DES with three keys to achieve a suitable strength.

---

### Table 8. FCS_COP.1 iterations (cryptographic operations)

<table>
<thead>

<td>FIPS PUB 197</td>
</tr>
</tbody>
</table>

1. Note that DES and triple DES with two keys are no longer recommended as encryption functions in the context of smart card applications. Hence, Security IC Embedded Software may need to use triple DES with three keys to achieve a suitable strength.

---

c. See the Datasheet referenced in *Section 7* for actual values.
The TSF shall ensure that all operations between any subject controlled by the TSF and any object controlled by the TSF are covered by an access control SFP.

**Security attribute based access control (FDP_ACF.1) / Memories**

The TSF shall enforce the *Dynamic Memory Access Control Policy* to objects based on the following: *software mode, the object location, the operation to be performed, and the current set of access rights*.

The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: *the operation is allowed if and only if the software mode, the object location and the operation matches an entry in the current set of access rights*.

The TSF shall explicitly authorise access of subjects to objects based on the following additional rules: *none*.

The TSF shall explicitly deny access of subjects to objects based on the following additional rules:

- *in User configuration, any access (read, write, execute) to the OST ROM is denied*.
- *in User configuration, any write access to the ST NVM is denied*.

**Note**: It should be noted that this level of policy detail is not needed at the application level. The composite Security Target writer should describe the ES access control and information flow control policies instead. Within the ES High Level Design description, the chosen setting of IC security attributes would be shown to implement the described policies relying on the IC SFP presented here.

The following SFP *Dynamic Memory Access Control Policy* is defined for the requirement "Security attribute based access control (FDP_ACF.1) / Memories":

**SFP_3: Dynamic Memory Access Control Policy**

*The TSF must control read, write, execute accesses of software to data, based on the software mode and on the current set of access rights.*

**Specification of management functions (FMT_SMF.1) / Memories**

The TSF shall be capable of performing the following management functions: *modification of the current set of access rights security attributes by software having the needed clearance, supporting the Dynamic Memory Access Control Policy*.

**5.1.4 Additional Security Functional Requirements related to the loading and authentication capabilities**

**Authentication Proof of Identity (FIA_API.1)**

The TSF shall provide a *command based on a cryptographic mechanism* to prove the identity of the TOE to an external entity.

**Limited capabilities (FMT_LIM.1) / Loader**

The TSF shall be designed and implemented in a manner that limits its capabilities so that in conjunction with "Limited availability (FMT_LIM.2)" the following policy is enforced: *Loader Limited Capability Policy*.
SFP_4: Loader Limited Capability Policy
Deploying Loader functionality after delivery does not allow stored user data to be disclosed or manipulated by unauthorized user.

Limited availability (FMT_LIM.2) / Loader
The TSF shall be designed and implemented in a manner that limits its availability so that in conjunction with “Limited capabilities (FMT_LIM.1)” the following policy is enforced: Loader Limited Availability Policy.

SFP_5: Loader Limited Availability Policy
The TSF prevents deploying the Loader functionality after blocking of the loader.

Note: Blocking the loader is just an option.

Inter-TSF trusted channel (FTP_ITC.1) / Loader
The TSF shall provide a communication channel between itself and another trusted IT product that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel data from modification or disclosure.

The TSF shall permit another trusted IT product to initiate communication via the trusted channel.

The TSF shall initiate communication via the trusted channel for Maintenance transaction.

Refinement:
In practice, the communication is not initiated by the TSF.

Basic data exchange confidentiality (FDP_UCT.1) / Loader
The TSF shall enforce the Loader SFP to receive user data in a manner protected from unauthorized disclosure.

Data exchange integrity (FDP_UIT.1) / Loader
The TSF shall enforce the Loader SFP to receive user data in a manner protected from modification, deletion, insertion errors.

The TSF shall be able to determine on receipt of user data, whether modification, deletion, insertion has occurred.

Subset access control (FDP_ACC.1) / Loader
The TSF shall enforce the Loader SFP on:

- the subjects ST Loader and User Loader,
- the objects user data in User NVM and ST data in ST NVM,
- the operation Maintenance transaction.

Security attribute based access control (FDP_ACF.1) / Loader
The TSF shall enforce the Loader SFP to objects based on the following: all subjects, objects and attributes defined in the Loader SFP.

The TSF shall enforce the following rules to determine if an operation among controlled subjects and controlled objects is allowed: if the user authenticated role is allowed to
perform the maintenance transaction and the maintenance transaction is legitimate and the loaded data emanates from an authorized originator.

Note that the term “data” also addresses Additional Code, as this code is seen as data by the TSF.

211 The TSF shall explicitly authorize access of subjects to objects based on the following additional rules: **none**.

212 The TSF shall explicitly deny access of subjects to objects based on the following additional rules: **none**.

213 The following SFP **Loader SFP** is defined for the requirements “Basic data exchange confidentiality (FDP_UCT.1) / Loader”, “Data exchange integrity (FDP_UIT.1) / Loader”, “Subset access control (FDP_ACC.1) / Loader”, “Security attribute based access control (FDP_ACF.1) / Loader”, “Static attribute initialisation (FMT_MSA.3) / Loader”, and “Management of security attributes (FMT_MSA.1) / Loader”:

214 **SFP 6: Loader SFP**

215 The TSF must enforce that a maintenance transaction is performed if and only if the user authenticated role is allowed to perform the maintenance transaction and the maintenance transaction is legitimate and the loaded data emanates from an authorized originator.

The TSF ruling is done according to a fixed access rights matrix, based on the subject, object and security attributes listed below.

The Security Function Policy (SFP) Loader SFP uses the following definitions:

- the subjects are the ST Loader and the User Loader,
- the objects are ST NVM and User NVM,
- the operation is Maintenance transaction,
- the security attributes linked to the subjects are the remaining sessions, the number of consecutive authentication failures, the allowed memory areas, the logging capacity, the transaction identification.

Note that subjects are authorized by cryptographic keys. These keys are considered as authentication data and not as security attributes.

**Failure with preservation of secure state (FPT_FLS.1) / Loader**

216 The TSF shall preserve a secure state when the following types of failures occur: **the maintenance transaction is incomplete**.

**Static attribute initialisation (FMT_MSA.3) / Loader**

217 The TSF shall enforce the **Loader SFP** to provide restrictive default values for security attributes that are used to enforce the SFP.

218 The TSF shall allow **none** to specify alternative initial values to override the default values when an object or information is created.

**Management of security attributes (FMT_MSA.1) / Loader**

219 The TSF shall enforce the **Loader SFP** to restrict the ability to modify the security attributes remaining sessions, transaction identification to the ST Loader or User Loader.
Specification of management functions (FMT_SMF.1) / Loader
220 The TSF shall be capable of performing the following management functions: change the role authentication data, change the remaining sessions, block a role, under the Loader SFP.

Security roles (FMT_SMR.1) / Loader
221 The TSF shall maintain the roles: ST Loader, User Loader, Secure Diagnostic, and Everybody.
222 The TSF shall be able to associate users with roles.

Timing of identification (FIA_UID.1) / Loader
223 The TSF shall allow boot, authentication command and non-critical queries on behalf of the user to be performed before the user is identified.
224 The TSF shall require each user to be successfully identified before allowing any other TSF mediated actions on behalf of that user.

Timing of authentication (FIA_UAU.1) / Loader
225 The TSF shall allow boot, authentication command and non-critical queries on behalf of the user to be performed before the user is authenticated.
226 The TSF shall require each user to be successfully authenticated before allowing any other TSF mediated actions on behalf of that user.

Audit storage (FAU_SAS.1) / Loader
227 The TSF shall provide the Loader with the capability to store the transaction identification of the loaded data in the NVM.
228 Refinement:
The TSF shall systematically store the transaction identification provided by the ST Loader or User Loader together with the loaded data.

Audit review (FAU_SAR.1) / Loader
229 The TSF shall provide Everybody with the capability to read the Product information and the Identification of the last completed maintenance transaction, if any, from the audit records.
230 The TSF shall provide the audit records in a manner suitable for the user to interpret the information.

5.1.5 Additional Security Functional Requirements related to the Secure Diagnostic capabilities

Limited capabilities (FMT_LIM.1) / Sdiag
231 The TSF shall be designed and implemented in a manner that limits its capabilities so that in conjunction with “Limited availability (FMT_LIM.2)” the following policy is enforced: Sdiag Limited Capability Policy.
232 SFP_7: Sdiag Limited Capability Policy
233 Deploying Secure Diagnostic capability does not allow stored user data of the Composite TOE to be disclosed or manipulated, TSF data to be disclosed or manipulated, software to be reconstructed and no substantial information about construction of TSF to be gathered which may enable other attacks.

**Limited availability (FMT_LIM.2) / Sdiag**

234 The TSF shall be designed and implemented in a manner that limits its availability so that in conjunction with “Limited capabilities (FMT_LIM.1)” the following policy is enforced: Sdiag Limited Availability Policy.

235 **SFP_8: Sdiag Limited Availability Policy**

236 The TSF prevents deploying the Secure Diagnostic capability unless the Secure Diagnostic mode is explicitly enabled by the authorized user. When the Secure Diagnostic capability is deployed, the TSF allows performing only authorized and authentic diagnostic transactions.

237 **Refinement:**

*By enabling the Secure Diagnostic capability, the Composite Product Manufacturer gives authority to the IC manufacturer to exercise the Secure Diagnostic capability known to abide by SFP_7.*

**Inter-TSF trusted channel (FTP_ITC.1) / Sdiag**

238 The TSF shall provide a communication channel between itself and another trusted IT product that is logically distinct from other communication channels and provides assured identification of its end points and protection of the channel data from modification or disclosure.

239 The TSF shall permit another trusted IT product to initiate communication via the trusted channel.

240 The TSF shall initiate communication via the trusted channel for Secure Diagnostic transaction.

241 **Refinement:**

*In practice, the communication is initiated by the trusted IT product.*

**Audit review (FAU_SAR.1) / Sdiag**

242 The TSF shall provide Everybody with the capability to read the Secure Diagnostic enable status, from the audit records.

243 The TSF shall provide the audit records in a manner suitable for the user to interpret the information.

**5.2 TOE security assurance requirements**

244 Security Assurance Requirements for the TOE for the evaluation of the TOE are those taken from the Evaluation Assurance Level 6 (EAL6) and augmented by taking the following components:

- **ALC_FLR.2.**

245 Regarding application note 22 of BSI-CC-PP-0084-2014, the continuously increasing maturity level of evaluations of Security ICs justifies the selection of a higher-level assurance package.
The component ALC_FLR.2 is chosen as an augmentation in this ST because a solid flaw management is key for the continuous improvement of the security IC platforms, especially on markets which need highly resistant and long lasting products.

The set of security assurance requirements (SARs) is presented in Table 9, indicating the origin of the requirement.

5.3 Refinement of the security assurance requirements

248 As *BSI-CC-PP-0084-2014* defines refinements for selected SARs, these refinements are also claimed in this Security Target.

249 The main customizing is that the IC Dedicated Software is an operational part of the TOE after delivery, although it is mainly not available to the user.

250 Regarding application note 23 of *BSI-CC-PP-0084-2014*, the refinements for all the assurance families have been reviewed for the hierarchically higher-level assurance components selected in this Security Target.

251 The text of the impacted refinements of *BSI-CC-PP-0084-2014* is reproduced in the next sections.

252 For reader’s ease, an impact summary is provided in Table 10.

5.3.1 Refinement regarding delivery procedure (ALC_DEL)

253 According to *JIL-Post-Deliv-Load*:

254 For the delivery of the Initial TOE, Additional Code and Final TOE, all the guidance describing the delivery procedures shall be taken into account.

255 They must especially describe the protection measures of the proof associated to the Additional Codes and the protection measures of the cryptographic keys used to generate this proof. The measures described in the guidance will have to be audited.
5.3.2 Refinement regarding functional specification (ADV_FSP)

Although the IC Dedicated Test Software is a part of the TOE, the test functions of the IC Dedicated Test Software are not described in the Functional Specification because the IC Dedicated Test Software is considered as a test tool delivered with the TOE but not providing security functions for the operational phase of the TOE. The IC Dedicated Software provides security functionalities as soon as the TOE becomes operational (boot software). These are properly identified in the delivered documentation.

The Functional Specification refers to datasheet to trace security features that do not provide any external interface but that contribute to fulfil the SFRs e.g. like physical protection. Thereby they are part of the complete instantiation of the SFRs.

The Functional Specification refers to design specifications to detail the mechanisms against physical attacks described in a more general way only, but detailed enough to be able to support Test Coverage Analysis also for those mechanisms where inspection of the layout is of relevance or tests beside the TSFI may be needed.

The Functional Specification refers to data sheet to specify operating conditions of the TOE. These conditions include but are not limited to the frequency of the clock, the power supply, and the temperature.

All functions and mechanisms which control access to the functions provided by the IC Dedicated Test Software (refer to the security functional requirement (FMT_LIM.2)) are part of the Functional Specification. Details will be given in the document for ADV_ARC, refer to Section 6.2.1.5. In addition, all these functions and mechanisms are subsequently refined according to all relevant requirements of the Common Criteria assurance class ADV because these functions and mechanisms are active after TOE Delivery and need to be part of the assurance aspects Tests (class ATE) and Vulnerability Assessment (class AVA). Therefore, all necessary information is provided to allow tests and vulnerability assessment.

Since the selected higher-level assurance component requires a security functional specification presented in a "semi-formal style" (ADV_FSP.5.2C) the changes affect the style of description, the BSI-CC-PP-0084-2014 refinements can be applied with changes covering the IC Dedicated Test Software and are valid for ADV_FSP.5.

5.3.3 Refinement regarding security policy model (ADV_SPM)

The CC V3.1 explains how a security policy model contributes to the documentation of the security functionality of the TOE and requires the developer to indicate the policies that are formally modeled by means of the assignment designed in the part 3 assurance component ADV_SPM.1.

Formal TOE security policy model (ADV_SPM.1)

The developer provides a formal security policy model for one of the following Security Functional Policies, to be defined after analysis:

1. **SFP_1**: Limited capability and availability Policy / Test,
2. **SFP_4**: Loader Limited Capability Policy and **SFP_5**: Loader Limited Availability Policy
3. **SFP_7**: Sdiag Limited Capability Policy and **SFP_8**: Sdiag Limited Availability Policy
4. **SFP_6**: Loader SFP.

For each policy covered by the formal security policy model, the model shall identifies the relevant portions of the statement of SFRs that make up that policy.
The developer shall provide a formal proof of correspondence between the model and any formal functional specification.

The developer shall provide a demonstration of correspondence between the model and the functional specification.

### 5.3.4 Refinement regarding test coverage (ATE_COV)

The TOE is tested under different operating conditions within the specified ranges. These conditions include but are not limited to the frequency of the clock, the power supply, and the temperature. This means that “Fault tolerance (FRU_FLT.2)” is proven for the complete TSF. The tests must also cover functions which may be affected by “ageing” (such as NVM writing).

The existence and effectiveness of measures against physical attacks (as specified by the functional requirement FPT_PHP.3) cannot be tested in a straightforward way. Instead STM provides evidence that the TOE actually has the particular physical characteristics (especially layout design principles). This is done by checking the layout (implementation or actual) in an appropriate way. The required evidence pertains to the existence of mechanisms against physical attacks (unless being obvious).

The IC Dedicated Test Software is seen as a “test tool” being delivered as part of the TOE. However, the Test Features do not provide security functionality. Therefore, Test Features need not to be covered by the Test Coverage Analysis but all functions and mechanisms which limit the capability of the functions (cf. FMT_LIM.1) and control access to the functions (cf. FMT_LIM.2) provided by the IC Dedicated Test Software must be part of the Test Coverage Analysis. **The IC Dedicated Software provides security functionalities as soon as the TOE becomes operational (boot software). These are part of the Test Coverage Analysis.**

### 5.3.5 Refinement regarding preparative procedures (AGD_PRE)

According to JIL-Post-Deliv-Load:

Preparative user guidance are intended to be used by persons responsible for the following tasks:
- acceptance of the Initial TOE and of the Additional Code;
- installation of the TOE: download of the Additional Code onto the Initial TOE, activation of the Additional Code, checking of the resulting Identification Data.

### 5.4 Security Requirements rationale

#### 5.4.1 Rationale for the Security Functional Requirements

Just as for the security objectives rationale of Section 4.3, the main line of this rationale is that the inclusion of all the security requirements of the BSI-CC-PP-0084-2014 protection profile, together with those in AUG, and with those introduced in this Security Target, guarantees that all the security objectives identified in Section 4 are suitably addressed by the security requirements stated in this chapter, and that the latter together form an internally consistent whole.

As origins of security objectives have been carefully kept in their labelling, and origins of security requirements have been carefully identified in Table 7 and Table 11, it can be verified that the justifications provided by the BSI-CC-PP-0084-2014 protection profile and AUG can just be carried forward to their union.

From Table 5, it is straightforward to identify additional security objectives for the TOE (AUG1.O.Add-Functions and AUG4.O.Mem-Access) tracing back to AUG, additional objectives (JIL.O.Prot-TSF-Confidentiality, JIL.O.Secure-Load-ACode, JIL.O.Secure-AC-Activation and JIL.O.TOE-Identification) tracing back to JIL-Post-Deliv-Load / ANSSI-CC-CER/F/06.003, and additional objectives (O.Secure-Load-AMemImage, O.MemImage-Identification, O.Firewall) introduced in this Security Target. This rationale must show that security requirements suitably address them all.

Furthermore, a careful observation of the requirements listed in Table 7 and Table 11 shows that:

- there are security requirements introduced from AUG (FCS_COP.1, FDP_ACC.2 / Memories, FDP_ACF.1 / Memories, FMT_MSA.3 / Memories and FMT_MSA.1 / Memories),
- there are additional security requirements introduced by this Security Target (FMT_MSA.3 / Loader, FMT_MSA.1 / Loader, FMT_SMF.1 / Loader, FMT_SMR.1 / Loader, FIA_UID.1 / Loader, FIA_UAU.1 / Loader, FTP_FLS.1 / Loader, FAU_SAS.1 / Loader, FAU_SAR.1 / Loader, FTP_ITC.1 / Sdiag, FAU_SAR.1 / Sdiag, FMT_LIM.1 / Sdiag, FMT_LIM.2 / Sdiag, and various assurance requirements of EAL6+).
Though it remains to show that:

- security objectives from this Security Target, from JIL-Post-Deliv-Load / ANSSI-CC-CER/F/06.003 and from AUG are addressed by security requirements stated in this chapter,
- additional security requirements from this Security Target and from AUG are mutually supportive with the security requirements from the BSI-CC-PP-0084-2014 protection profile, and they do not introduce internal contradictions,
- all dependencies are still satisfied.

The justification that the additional security objectives are suitably addressed, that the additional security requirements are mutually supportive and that, together with those already in BSI-CC-PP-0084-2014, they form an internally consistent whole, is provided in the next subsections.

### Extended security objectives are suitably addressed

The justification related to the security objective “Dynamic Area based Memory Access Control (AUG4.O.Mem-Access)” is as follows:

The security functional requirements “Complete access control (FDP_ACC.2) / Memories” and “Security attribute based access control (FDP_ACF.1) / Memories”, with the related Security Function Policy (SFP) “Dynamic Memory Access Control Policy” exactly require to implement a Dynamic area based memory access control as demanded by AUG4.O.Mem-Access. Therefore, FDP_ACC.2 / Memories and FDP_ACF.1 / Memories with their SFP are suitable to meet the security objective.

The security functional requirement “Static attribute initialisation (FMT_MSA.3) / Memories” requires that the TOE provides default values for security attributes. The ability to update the security attributes is restricted to privileged subject(s) as further detailed in the security functional requirement "Management of security attributes (FMT_MSA.1) / Memories” These management functions ensure that the required access control can be realised using the functions provided by the TOE.

#### Security objective “Additional Specific Security Functionality (AUG1.O.Add-Functions)”

The justification related to the security objective “Additional Specific Security Functionality (AUG1.O.Add-Functions)” is as follows:

The security functional requirements “Cryptographic operation (FCS_COP.1)” and "Additional Security Functional Requirements for the memories protection" exactly require those functions to be implemented that are demanded by AUG1.O.Add-Functions. Therefore, FCS_COP.1 is suitable to meet the security objective.

#### Security objective “Protection against Abuse of Functionality (BSI.O.Abuse-Func)”

This objective states that abuse of functions (especially provided by the IC Dedicated Test Software, for instance in order to read secret data) must not be possible in Phase 7 of the life-cycle. There are two possibilities to achieve this: (i) They cannot be used by an attacker (i.e. its availability is limited) or (ii) using them would not be of relevant use for an attacker (i.
e. its capabilities are limited) since the functions are designed in a specific way. The first possibility is specified by "Limited availability (FMT_LIM.2) / Test" and "Limited availability (FMT_LIM.2) / Sdiag", and the second one by "Limited capabilities (FMT_LIM.1) / Test" and "Limited capabilities (FMT_LIM.1) / Sdiag". Since these requirements are combined to support the policy, which is suitable to fulfil O.Abuse-Func, these security functional requirements together are suitable to meet the objective.

284 Other security functional requirements which prevent attackers from circumventing the functions implementing these two security functional requirements (for instance by manipulating the hardware) also support the objective. The relevant Security Functional requirements are also listed in Table 11.

Security objective “Access control and authenticity for the Loader (BSI.O.Ctrl-Auth-Loader)”

285 The justification related to the security objective “Access control and authenticity for the Loader (BSI.O.Ctrl-Auth-Loader)” is as follows:

286 The security functional requirement "Subset access control (FDP_ACC.1) / Loader" defines the subjects, objects and operations of the Loader SFP enforced by the SFR FTP_ITC.1 / Loader, FDP_UCT.1 / Loader, FDP_UIT.1 / Loader and FDP_ACF.1 / Loader. The security functional requirement "Inter-TSF trusted channel (FTP_ITC.1) / Loader" requires the TSF to establish a trusted channel with assured identification of its end points and protection of the channel data from modification or disclosure. The security functional requirement "Basic data exchange confidentiality (FDP_UCT.1) / Loader" requires the TSF to receive data protected from unauthorized disclosure. The security functional requirement "Data exchange integrity (FDP_UIT.1) / Loader" requires the TSF to verify the integrity and the rightfulness of the received data. The security functional requirement "Security attribute based access control (FDP_ACF.1) / Loader" requires the TSF to implement access control for the Loader functionality. Therefore, FTP_ITC.1 / Loader, FDP_UCT.1 / Loader, FDP_UIT.1 / Loader, FDP_ACC.1 / Loader and FDP_ACF.1 / Loader with their SFP are suitable to meet the security objective.

287 Complementary, the security functional requirement "Static attribute initialisation (FMT_MSA.3) / Loader" requires that the TOE provides default values for security attributes. The ability to update the security attributes is restricted to privileged subject(s) as further detailed in the security functional requirement "Management of security attributes (FMT_MSA.1) / Loader". The security functional requirements "Security roles (FMT_SMR.1) / Loader", "Timing of identification (FIA_UID.1) / Loader" and "Timing of authentication (FIA_UAU.1) / Loader" specify the roles that the TSF recognises and the actions authorized before their identification. The security functional requirement "Specification of management functions (FMT_SMF.1) / Loader" provides additional controlled facility for adapting the loader behaviour to the user’s needs. These management functions ensure that the required access control, associated to the loading feature, can be realized using the functions provided by the TOE.

The justification related to the security objectives “Protection of the confidentiality of the TSF (JIL.O.Prot-TSF-Confidentiality)”, “Secure loading of the Additional Code (JIL.O.Secure-Load-ACode)” and “Secure loading of the Additional Memory Image (O.Secure-Load-AMemImage)” is as follows:

The security functional requirement "Subset access control (FDP_ACC.1) / Loader" defines the subjects, objects and operations of the Loader SFP enforced by the SFR FTP_ITC.1, FDP_UCT.1, FDP_UIT.1 and FDP_ACF.1/Loader.

The security functional requirement "Inter-TSF trusted channel (FTP_ITC.1) / Loader" requires the TSF to establish a trusted channel with assured identification of its end points and protection of the channel data from modification or disclosure.

The security functional requirement "Basic data exchange confidentiality (FDP_UCT.1) / Loader" requires the TSF to receive data protected from unauthorized disclosure.

The security functional requirement "Data exchange integrity (FDP_UIT.1) / Loader" requires the TSF to verify the integrity of the received data.

The security functional requirement "Security attribute based access control (FDP_ACF.1) / Loader" requires the TSF to implement access control for the Loader functionality.

The security functional requirement "Static attribute initialisation (FMT_MSA.1) / Loader" requires that the TOE provides default values for security attributes.

The ability to update the security attributes is restricted to privileged subject(s) as further detailed in the security functional requirement "Management of security attributes (FMT_MSA.1) / Loader".

The security functional requirements "Security roles (FMT_SMR.1) / Loader", "Timing of identification (FIA_UID.1) / Loader" and "Timing of authentication (FIA_UAU.1) / Loader" specify the roles that the TSF recognises and the actions authorized before their identification.

The security functional requirement "Specification of management functions (FMT_SMF.1) / Loader" provides additional controlled facility for adapting the loader behaviour to the user’s needs. These management functions ensure that the required access control, associated to the loading feature, can be realised using the functions provided by the TOE.

The security functional requirement "Audit storage (FAU_SAS.1) / Loader" requires to store the identification data needed to enforce that only the allowed version of the Additional Memory Image can be loaded on the Initial TOE.

Therefore, FTP_ITC.1 / Loader, FDP_UCT.1 / Loader, FDP_UIT.1 / Loader, FDP_ACF.1 / Loader, FMT_MSA.1 / Loader, FMT_MSA.3 / Loader, FMT_SMR.1 / Loader, FMT_SMF.1 / Loader, FIA_UID.1 / Loader, FIA_UAU.1 / Loader, and FAU_SAS.1 / Loader are suitable to meet these security objectives.

Security objective “Secure activation of the Additional Code (JIL.O.Secure-AC-Activation)”

The justification related to the security objective “Secure activation of the Additional Code (JIL.O.Secure-AC-Activation)” is as follows:

The security functional requirement "Audit storage (FAU_SAS.1) / Loader" requires the TSF to fail secure unless the Loading of the Additional Memory Image, including update of the Identification data, is comprehensive, as specified by JIL.O.Secure-AC-Activation.

Therefore, FPT_FLS.1 / Loader is suitable to meet this security objective.
Security objective “Secure identification of the TOE (JIL.O.TOE-Identification)"

The justification related to the security objective “Secure identification of the TOE (JIL.O.TOE-Identification)” is as follows:

The security functional requirement "Audit storage (FAU_SAS.1) / Loader" requires the TSF to store the Identification Data of the Memory Images. The security functional requirement "Stored data integrity monitoring and action (FDP_SDI.2)" requires the TSF to detect the integrity errors of the stored data and react in case of detected errors. The security functional requirement "Audit review (FAU_SAR.1) / Loader" allows any user to read this Identification Data.

Therefore, FAU_SAS.1 / Loader, and FAU_SAR.1 / Loader together with FDP_SDI.2 are suitable to meet this security objective.

Security objective “Secure identification of the Memory Image (O.MemImage-Identification)"

The justification related to the security objective “Secure identification of the Memory Image (O.MemImage-Identification)” is as follows:

The security functional requirement "Audit storage (FAU_SAS.1) / Loader" requires the TSF to store the Identification Data of the Memory Images. The security functional requirement "Stored data integrity monitoring and action (FDP_SDI.2)" requires the TSF to detect the integrity errors of the stored user data and react in case of detected errors. The security functional requirement "Audit review (FAU_SAR.1) / Loader" allows any user to read this Identification Data. The security functional requirement "Audit storage (FAU_SAS.1) / Loader" requires the TSF to fail secure unless the Loading of the Additional Memory Image, including update of the Identification data, is comprehensive, as specified by JIL.O.Secure-AC-Activation.

Therefore, FAU_SAS.1 / Loader, FAU_SAR.1 / Loader together with FDP_SDI.2 and FPT_FLS.1 / Loader are suitable to meet this security objective.

Security objective “Specific application firewall (O.Firewall)"

The justification related to the security objective “Specific application firewall (O.Firewall)” is as follows:

The security functional requirements "Complete access control (FDP_ACC.2) / Memories" and "Security attribute based access control (FDP_ACF.1) / Memories", supported by "Static attribute initialisation (FMT_MSA.3) / Memories", require that no application can read, write, compare any piece of data or code belonging to a specific application. This meets the security objective O.Firewall.

The security attributes addressed by the functional requirements "Management of security attributes (FMT_MSA.1) / Memories" and "Specification of management functions (FMT_SMF.1) / Memories" ensure that the required access control can be realised using the functions provided by the TOE.
5.4.3 Additional security requirements are consistent

"Cryptographic operation (FCS_COP.1)"

These security requirements have already been argued in Section : Security objective "Additional Specific Security Functionality (AUG1.O.Add-Functions)" above.

"Static attribute initialisation (FMT_MSA.3 / Memories), Management of security attributes (FMT_MSA.1 / Memories), Complete access control (FDP_ACC.2 / Memories), Security attribute based access control (FDP_ACF.1 / Memories)"

These security requirements have already been argued in Section : Security objective "Dynamic Area based Memory Access Control (AUG4.O.Mem-Access)" and Section : Security objective "Specific application firewall (O.Firewall)" above.

"Static attribute initialisation (FMT_MSA.3 / Loader), Management of security attributes (FMT_MSA.1 / Loader), Specification of management function (FMT_SMF.1 / Loader), Security roles (FMT_SMR.1 / Loader), Timing of identification (FIA_UID.1 / Loader), Timing of authentication (FIA_UAU.1 / Loader)"

"Audit storage (FAU_SAS.1 / Loader), Audit review (FAU_SAR.1 / Loader)"

These security requirements have already been argued in Section : Security objective "Secure identification of the TOE (JIL.O.TOE-Identification)” and Section : Security objective “Secure identification of the Memory Image (O.MemImage-Identification)” above.

"Failure with preservation of secure state (FPT_FLS.1 / Loader)"

This security requirement has already been argued in Section : Security objective “Secure activation of the Additional Code (JIL.O.Secure-AC-Activation)” and Section : Security objective “Secure identification of the Memory Image (O.MemImage-Identification)” above.

"Inter-TSF trusted channel(FTP_ITC.1 / Sdiag), Audit review (FAU_SAR.1 / Sdiag), Limited capabilities (FMT_LIM.1 / Sdiag), Limited availability (FMT_LIM.2 / Sdiag)"

These security requirements have already been argued in Section : Security objective “Protection against Abuse of Functionality (BSI.O.Abuse-Func)” above.
5.4.4 Dependencies of Security Functional Requirements

All dependencies of Security Functional Requirements have been fulfilled in this Security Target except:

- those justified in the *BSI-CC-PP-0084-2014* protection profile security requirements rationale,
- those justified in *AUG* security requirements rationale,
- the dependency of *FCS_COP.1* on *FCS_CKM.4* (see discussion below),
- the dependency of *FAU_SAR.1 / Loader* on *FAU_GEN.1* (see discussion below),
- the dependency of *FAU_SAR.1 / Sdiag* on *FAU_GEN.1* (see discussion below).

Details are provided in Table 12 below.

311 Part 2 of the Common Criteria defines the dependency of "Cryptographic operation (FCS_COP.1)" on "Import of user data without security attributes (FDP_ITC.1)" or "Import of user data with security attributes (FDP_ITC.2)" or "Cryptographic key generation (FCS_CKM.1)". In this particular TOE, the ES has all possibilities to implement its own creation function, in conformance with its security policy.

312 Part 2 of the Common Criteria defines the dependency of "Cryptographic operation (FCS_COP.1)" on "Cryptographic key destruction (FCS_CKM.4)". In this particular TOE, there is no specific function for the destruction of the keys. The ES has all possibilities to implement its own destruction function, in conformance with its security policy. Therefore, FCS_CKM.4 is not defined in this ST.

313 Part 2 of the Common Criteria defines the dependency of "Audit review (FAU_SAR.1) / Loader" on "Audit data generation (FAU_GEN.1)". In this particular TOE, "Audit storage (FAU_SAS.1) / Loader" is used to ensure the storage of audit data, because FAU_GEN.1 is too comprehensive to be used in this context. Therefore this dependency is fulfilled by "Audit storage (FAU_SAS.1) / Loader" instead.
Part 2 of the Common Criteria defines the dependency of "Audit review (FAU_SAR.1) / Sdiag" on "Audit data generation (FAU_GEN.1)". In this particular TOE, there is no specific function for audit data generation, the data to be audited are just stored. Therefore, FAU_GEN.1 is not defined in this ST.

5.4.5 Rationale for the Assurance Requirements

Security assurance requirements added to reach EAL6 (Table 9)

Regarding application note 21 of BSI-CC-PP-0084-2014, this Security Target chooses EAL6 because developers and users require a high level of independently assured security in a planned development and require a rigorous development approach without incurring unreasonable costs attributable to specialist security engineering techniques.

EAL6 represents a meaningful increase in assurance from EAL4 by requiring a formal security policy model, semiformal design descriptions, a more structured (and hence analyzable) architecture, extensive testing, and improved mechanisms and/or procedures that provide confidence that the TOE will not be tampered during development.

The assurance components in an evaluation assurance level (EAL) are chosen in a way that they build a mutually supportive and complete set of components. The requirements chosen for augmentation do not add any dependencies, which are not already fulfilled for the corresponding requirements contained in EAL6. Therefore, these components add additional assurance to EAL6, but the mutual support of the requirements and the internal consistency is still guaranteed.

Note that detailed and updated refinements for assurance requirements are given in Section 5.3.

Dependencies of assurance requirements

Dependencies of security assurance requirements are fulfilled by the EAL6 package selection.

The augmentation to this package identified in paragraph 244 does not introduce dependencies not already satisfied by the EAL6 package, and is considered as consistent augmentation:

- ALC_FLR.2 has no dependency.
6 TOE summary specification (ASE_TSS)

This section demonstrates how the TOE meets each Security Functional Requirement, which will be further detailed in the ADV_FSP documents.

6.1 Limited fault tolerance (FRUFLT.2)

The TSF provides limited fault tolerance, by managing a certain number of faults or errors that may happen, related to random number generation, power supply, data flows and cryptographic operations, thus preventing risk of malfunction.

6.2 Failure with preservation of secure state (FPT_FLS.1)

The TSF provides preservation of secure state by detecting and managing events that cannot be tolerated, resulting in an immediate interruption or reset:

- The ES can generate a software reset.

6.3 Limited capabilities (FMT_LIM.1) / Test, Limited capabilities (FMT_LIM.1) / Sdiag, Limited capabilities (FMT_LIM.1) / Loader, Limited availability (FMT_LIM.2) / Test, Limited availability (FMT_LIM.2) / Sdiag & Limited availability (FMT_LIM.2) / Loader

- The TOE is either in Test, Admin or User configuration.
- The TOE may also be in Basic Diagnostic (aka Diagnostic) or Secure Diagnostic volatile configuration.
- The Test and Diagnostics configurations are reserved to ST.
- The TSF ensures the switching and the control of TOE configuration, the corresponding access control and the control of the corresponding capabilities. The transition controls rely on several strong mechanisms including fuse, authentication and control registers. Part of the transitions are only possible in the STMicroelectronics audited environment.
- The TSF reduces the available features depending on the TOE configuration.
- The customer can choose to disable irreversibly the Loading capability.
- The customer can choose to enable or disable irreversibly the Secure Diagnostic capability. Only if the customer enables it, ST can exercise the Secure Diagnostic capability for quality investigation purpose with a secure protocol, in a secured environment.

6.4 Inter-TSF trusted channel (FTP_ITC.1) / Sdiag

In Secure Diagnostic volatile configuration, the System Firmware provides a secure channel to allow another IT product to operate a Secure Diagnostic transaction.
6.5 Audit review (FAU_SAR.1) / Sdiag
333 The System Firmware allows to read the Secure Diagnostic status (permanently disabled, permanently enabled, disabled but still configurable).

6.6 Stored data confidentiality (FDP_SDC.1)
334 The TSF ensures confidentiality of the User Data, thanks to the following features:
  • Memories scrambling and encryption,
  • MMF,
  • LPU,
  • Active shields.

6.7 Stored data integrity monitoring and action (FDP_SDI.2)
335 The TSF ensures integrity of the stored data, thanks to the following features:
  • Memories EDC (Error Detecting Code) / ECC (Error Correcting Code),
  • MMF,
  • LPU.

6.8 Audit storage (FAU_SAS.1)
336 In User configuration, the TOE provides commands to store data and/or pre-personalisation data and/or supplements of the ES in the NVM. These commands are only available to authorized processes before delivery.

6.9 Resistance to physical attack (FPT_PHP.3)
337 The TSF ensures resistance to physical tampering, thanks to the following features:
  • The TOE implements a set of countermeasures that reduce the exploitability of physical probing.
  • The TOE is physically protected by active shields that command an automatic reaction on die integrity violation detection.

6.10 Basic internal transfer protection (FDP_ITT.1), Basic internal TSF data transfer protection (FPT_ITT.1) & Subset information flow control (FDP_IFC.1)
338 The TSF prevents the disclosure of internal and user data thanks to:
  • Memories scrambling and encryption,
  • Bus encryption,
  • Mechanisms for operation execution concealment.
6.11 Random number generation (FCS_RNG.1)

The TSF provides true random numbers that can be qualified with the test metrics required by the BSI-AIS20/AIS31 standard for a PTG.2 class device.

6.12 Cryptographic operation: DES operation (FCS_COP.1) / TDES

The TOE provides optionally an EDES+ accelerator that has the capability to perform Triple DES encryption and decryption in Electronic Code Book (ECB) and Cipher Block Chaining (CBC) modes conformant to NIST SP 800-67 and NIST SP 800-38A.

6.13 Cryptographic operation: AES operation (FCS_COP.1) / AES

The TOE provides optionally an AES accelerator allowing the following standard AES cryptographic operations for key sizes of 128, 192 and 256 bits, conformant to FIPS PUB 197 with intrinsic counter-measures against attacks:
- cipher,
- inverse cipher.

The AES accelerator can operate in Electronic Code Book (ECB) and Cipher Block Chaining (CBC) modes.

6.14 Static attribute initialisation (FMT_MSA.3) / Memories

The TOE enforces a default memory management policy when none other is programmed by the ES.

6.15 Management of security attributes (FMT_MSA.1) / Memories & Specification of management functions (FMT_SMF.1) / Memories

The TOE provides a dynamic Memory Management Function (MMF) offering translation capability and protection with dedicated access permission to 16 different memory regions, that can be configured by the ES.

The Library Protection Unit (LPU) offers complementary memory protections, that can be configured in Admin configuration, in case the LPU is not reserved to ST.

6.16 Complete access control (FDP_ACC.2) / Memories & Security attribute based access control (FDP_ACF.1) / Memories

The TOE enforces the dynamic memory management policy for data access and code access thanks to a dynamic Memory Management Function (MMF) and a Library Protection Unit (LPU), programmed by the ES.
Overriding the MMF and LPU set of access rights, depending on the TOE configuration, the TOE enforces additional protections on specific parts of the memories.

6.17 **Authentication Proof of Identity (FIA_API.1)**

In Admin configuration, the System Firmware provides commands based on a cryptographic mechanism which allows another IT product to check that the TOE is a genuine TOE.

6.18 **Inter-TSF trusted channel (FTP_ITC.1) / Loader, Basic data exchange confidentiality (FDP_UCT.1) / Loader, Data exchange integrity (FDP_UIT.1) / Loader & Audit storage (FAU_SAS.1) / Loader**

In Admin configuration, the System Firmware provides a secure channel to allow another IT product to operate a maintenance transaction.

The ciphered data is automatically decrypted then stored in the requested memory.

A maintenance transaction can end only after a successful integrity check of the loaded data or an erase. The identification data associated with the memory update is automatically logged during the session.

6.19 **Subset access control (FDP_ACC.1) / Loader & Security attribute based access control (FDP_ACF.1) / Loader**

In Admin configuration, during a maintenance transaction, the System Firmware verifies if the Loader access conditions are satisfied and returns an error when this is not the case.

In particular, the additional memory update must be intended to be assembled with the memory update previously loaded.

6.20 **Failure with preservation of secure state (FPT_FLS.1) / Loader**

In Admin configuration, the System Firmware provides preservation of secure state by forcing a reset if an abnormal behavior is detected. It also enforces that a maintenance transaction can only end when it is consistent or canceled by an erase.

6.21 **Static attribute initialisation (FMT_MSA.3) / Loader**

In Admin configuration, the System Firmware provides restrictive default values for the Flash Loader security attributes.
6.22 Management of security attributes (FMT_MSA.1) / Loader & Specification of management functions (FMT_SMF.1) / Loader

In Admin configuration, the System Firmware provides the capability for an authorized user to change part of the Flash Loader security attributes.

6.23 Security roles (FMT_SMR.1) / Loader

The System Firmware supports the assignment of roles to users through the assignment of different keys for the different roles. This allows to distinguish between the roles of ST Loader, User Loader, Secure Diagnostic, and Everybody.

6.24 Timing of identification (FIA_UID.1) / Loader & Timing of authentication (FIA_UAU.1) / Loader

The System Firmware identifies the user through the key selected for authentication. This is performed by verifying an encryption, thus preventing to unveil the key.

After this authentication, both parties share a session key.

A limited number of operations is allowed on behalf of the user before the user is identified and authenticated, such as boot, authentication and non-critical queries.

6.25 Audit review (FAU_SAR.1) / Loader

In Admin configuration, the System Firmware allows to read the product information and the identification data of all memory updates previously loaded on the TOE.
7 Identification

Appendix A  Glossary

A.1  Terms

Additional Code
From the loader perspective, code activated by the Atomic Activation on the Initial TOE to generate the final TOE. For instance, Additional Code could: correct flaws, add new functionalities, update the operating system... An Additional Code is a particular « memory image » that has been activated in an authorized way on behalf of the TOE owner.

Atomic activation
The Loader guarantees at activation time that the loaded Additional Code is activated and that the Identification Data of the TOE are updated. This functionality is called Atomic Activation. If the Atomic Activation is successful, then the resulting product is the Final TOE, otherwise (in case of interruption or incident which prevents the forming of the Final TOE), the Initial TOE shall remain in its initial state or fail secure.

Authorized user
A user who may, in accordance with the TSP, perform an operation.

Composite product
Security IC product which includes the Security Integrated Circuit (i.e. the TOE) and the Embedded Software and is evaluated as composite target of evaluation.

End-consumer
User of the Composite Product in Phase 7.

Final TOE
From the loader perspective, the Final TOE is generated from the Initial TOE and the Additional Code. It is the resulting product of the Atomic Activation of the Additional Code onto the Initial TOE. Here the term TOE denotes the TOE itself as well as the composite TOE considered as a memory image which both may be maintained by a maintenance transaction.

IC Dedicated Software
IC proprietary software embedded in a Security IC (also known as IC firmware) and developed by ST. Such software is required for testing purpose (IC Dedicated Test Software) but may provide additional services to facilitate usage of the hardware and/or to provide additional services (IC Dedicated Support Software).

IC Dedicated Test Software
That part of the IC Dedicated Software which is used to test the TOE before TOE Delivery but which does not provide any functionality thereafter.

IC developer
Institution (or its agent) responsible for the IC development.

IC manufacturer
Institution (or its agent) responsible for the IC manufacturing, testing, and pre-personalization.

IC packaging manufacturer
Institution (or its agent) responsible for the IC packaging and testing.

Initial TOE
From the loader perspective, the Initial TOE is the product on which the Additional Code is loaded and with the Loader as part of the embedded software. Here the term TOE denotes the TOE itself as well as the composite TOE which both may be maintained by loading of an additional memory image.

**Initialisation data**
Initialisation Data defined by the TOE Manufacturer to identify the TOE and to keep track of the Security IC’s production and further life-cycle phases are considered as belonging to the TSF data. These data are for instance used for traceability and for TOE identification (identification data). If “Package Authentication of the Security IC” is used the Initialisation data contain the confidential authentication verification data of the IC. If the “Package 2: Loader dedicated for usage by authorized users only” may contain the authentication verification data or key material for the trusted channel between the TOE and the authorized users using the Loader.

**Integrated Circuit (IC)**
Electronic component(s) designed to perform processing and/or memory functions.

**Loader**
The Loader is the software developed by the Product Manufacturer. It is used to load and activate the Additional Code into the Product FLASH memory. The Loader is included in the dedicated software and is part of the TOE.

**Maintenance transaction**
Modification of an initial memory image by an additional memory image resulting in a final memory image.

**Memory image**
Set of mappings of memory addresses onto data.

**Object**
An entity within the TSC that contains or receives information and upon which subjects perform operations.

**Packaged IC**
Security IC embedded in a physical package such as micromodules, DIPs, SOICs or TQFPs.

**Pre-personalization data**
Any data supplied by the Card Manufacturer that is injected into the non-volatile memory by the Integrated Circuits manufacturer (Phase 3). These data are for instance used for traceability and/or to secure shipment between phases. If “Package 2: Loader dedicated for usage by authorized users only” is used the Prepersonalisation Data may contain the authentication reference data or key material for the trusted channel between the TOE and the authorized users using the Loader.

**Secret**
Information that must be known only to authorized users and/or the TSF in order to enforce a specific SFP.

**Security IC**
Composition of the TOE, the Security IC Embedded Software, User Data, and the package.

**Security IC Embedded Software (ES)**
Software embedded in the Security IC and not developed by the IC designer. The Security IC Embedded Software is designed in Phase 1 and embedded into the Security IC in Phase 3 or in later phases of the Security IC product life-cycle.
Some part of that software may actually implement a Security IC application whereas others may provide standard services. Nevertheless, this distinction doesn’t matter here so that the Security IC Embedded Software can be considered as being application dependent whereas the IC Dedicated Software is definitely not.

**Security IC embedded software (ES) developer**

Institution (or its agent) responsible for the security IC embedded software development and the specification of IC pre-personalization requirements, if any.

**Security attribute**

Information associated with subjects, users and/or objects that is used for the enforcement of the TSP.

**Sensitive information**

Any information identified as a security relevant element of the TOE such as:

– the application data of the TOE (such as IC pre-personalization requirements, IC and system specific data),

– the security IC embedded software,

– the IC dedicated software,

– the IC specification, design, development tools and technology.

**Smartcard**

A card according to ISO 7816 requirements which has a non volatile memory and a processing unit embedded within it.

**Subject**

An entity within the TSC that causes operations to be performed.

**Test features**

All features and functions (implemented by the IC Dedicated Software and/or hardware) which are designed to be used before TOE Delivery only and delivered as part of the TOE.

**TOE Delivery**

The period when the TOE is delivered which is after Phase 4 in this Security target.

**TSF data**

Data for the operation of the TOE upon which the enforcement of the SFR relies. They are created by and for the TOE, that might affect the operation of the TOE. This includes information about the TOE’s configuration, if any is coded in non-volatile non-programmable memories (ROM), in non-volatile programmable memories (for instance EEPROM or flash memory), in specific circuitry or a combination thereof.

**User**

Any entity (human user or external IT entity) outside the TOE that interacts with the TOE.

**User data of the Composite TOE**

All data managed by the Smartcard Embedded Software in the application context.

**User data of the TOE**

Data for the user of the TOE, that does not affect the operation of the TSF. From the point of view of TOE defined in this PP the user data comprises the Security IC Embedded Software and the user data of the Composite TOE.

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

ST PRODUCTS ARE NOT DESIGNED OR AUTHORIZED FOR USE IN: (A) SAFETY CRITICAL APPLICATIONS SUCH AS LIFE SUPPORTING, ACTIVE IMPLANTED DEVICES OR SYSTEMS WITH PRODUCT FUNCTIONAL SAFETY REQUIREMENTS; (B) AERONAUTIC APPLICATIONS; (C) AUTOMOTIVE APPLICATIONS OR ENVIRONMENTS, AND/OR (D) AEROSPACE APPLICATIONS OR ENVIRONMENTS. WHERE ST PRODUCTS ARE NOT DESIGNED FOR SUCH USE, THE PURCHASER SHALL USE PRODUCTS AT PURCHASER'S SOLE RISK, EVEN IF ST HAS BEEN INFORMED IN WRITING OF SUCH USAGE, UNLESS A PRODUCT IS EXPRESSLY DESIGNATED BY ST AS BEING INTENDED FOR "AUTOMOTIVE, AUTOMOTIVE SAFETY OR MEDICAL" INDUSTRY DOMAINS ACCORDING TO ST PRODUCT DESIGN SPECIFICATIONS. PRODUCTS FORMALLY ESCC, QML OR JAN QUALIFIED ARE DEEMED SUITABLE FOR USE IN AEROSPACE BY THE CORRESPONDING GOVERNMENTAL AGENCY.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.

ST and the ST logo are trademarks or registered trademarks of ST in various countries.
